JUNE 1942 New Plymouth In JUNE 1942 New Plymouth apprentice engineer George Wood said he was 18. Actually he was 17, but he'd just raised his age by a year to become a part of preparations taking place throughout New Zealand to counter the threat of invasion by the

Up until then, World War II had been a remote sort of event taking place on the other side of the world.

But in December 1941 the Japanese entered the conflict when they attacked the US naval base at Pearl Harbour in Hawaii, then rapidly conquered Indo-China, the Dutch East Indies, Malaya, Singapore and Hong Kong. And when Darwin in Australia was flattened by Japanese bombs, the possibility of inva-sion here became frighteningly real. New Plymouth responded to this

threat with urgency because it was considered that the city, featuring the only deep-water port along New Zealand western seaboard, was a prime potential target. Pill boxes and tank traps were constructed at strategic points, home owners dug slit trenches, barbed wire entanglements were erected along beaches, the army occupied cottages at Ngamotu Beach, a Second Battalion Taranaki Regiment was formed and stationed in the Waiwakaiho Valley, a home guard was recruited, and a trans-port section was formed for the distribu-tion of supplies.

And to prepare for the expected air raids, a special bomb disposal group was recruited to be trained in the potentially deadly art of disarming and disposing unexploded bombs.

Teenager George Wood, caught up in the surge of patriotism that swept Taranaki and indeed all of New Zealand, could not wait to become involved in all the action about him. So, in June 1942, he raised his age and applied to join the 2/C Company Bomb Disposal Group. After an interview he was duly accepted as a sapper with this New Plymouth-based branch of the Army Engineers and he and 37 others began intensive

This involved hours of lectures and practical work on a wide variety of bombs in-cluding high-explosive types, anti-per-sonnel and incendiary bombs, nose

fuses, tail fuses and delayed fuses There were also regular call-out duties throughout Taranaki to deal with such problems as dud hand grenades, unexploded aerial bombs and mortar

shells that had not detonated

While a good portion of the early training concentrated on explosives likely to be delivered from the air by Japanese aircraft, the Japanese were not the only only enemy threatening New Zealand. Off the coast were the Germans with their auxiliary cruisers, which were heavily disguised converted merchant ships, carrying guns, torpedo tubes, sea lanes — and between 200 and 400 mines.

Mines proved deadly to shipping worldwide during World War II. The most common was the contact moored type, which was mounted on an anchor box housing a mooring cable and drum. A plummet weight was also attached by

rope to a brake on the cable drum.

When the entire setup was pushed over the stern of the mine-laying vessel, the mine would float while the anchor box would begin to sink and unwind the mooring cable. The plummet weight would be positioned a slight distance below the box and would hit the seabed The day World War II touched New Plymouth

Fifty-five years ago tomorrow, World War II literally touched New Plymouth. A rogue German naval contact mine floated in from somewhere out in the Tasman Sea, and crashed ashore in heavy seas directly below the Belt Road campsite. The mine was lethal. Carrying 450lbs of TNT, its blast would kill anyone within a 300metre radius and would break windows a kilometre away. It had to be quickly removed from one of the most densely populated areas of the city. That responsibility lay with a small and little-known wartime organisation — New Plymouth-based 2/C Company Bomb Disposal Group, a bunch of Taranaki men hastily formed in mid-1942 to assist in the defence of New Zealand against threatened invasion by the Japanese. ROB MAETZIG backgrounds a tale of heroism and hair-raising antics all those years ago, on February 15, 1943 . . .

en they broke free, but often didn't. first, and the subsequent loss of weight would cause the cable drum to brake.

PRICKLY SITUATION: The mines were meant to

The box would continue downwards until it also hit the seabed, and in doing so it would anchor the mine slightly below the surface of the sea.

And that action of dragging the mine below the surface also did something else — it extended a mooring spindle from the bottom on the mine's casing, and armed it.

HILE hundreds of these contact mines were laid at standard V cations in Hauraki Gulf, none was laid off the Taranaki coast - but way to the west, the vessels Pinguin and Passat, busied themselves laying several hundred contact mines between Tasmania and mainland Australia late in

Some broke free, became caught in the westerly seaward drift known as the Roaring Forties and floated towards

A year later they began arriving. The first to be washed ashore in Taranaki was spotted on November 28, 1942, on a remote beach near Bell Block, and 2/C Company Bomb Disposal Group assisted a naval mine disposal detachment drag the mine into shallow water and disarm

it. Five days later a second mine washed ashore at Mokau, but because it landed on the northern side of the river it became the responsibility of a bomb dis-posal group based in Auckland. Today that mine is mounted on a concrete base that mine is mounted on a concrete base in front of the Mokau shops.

in front of the Mokau shops.
Then on February 15, 1943, another mine washed ashore in Taranaki — but this time the location was uncomfartably close. A fresheming northerly sea pushed it on to the coast below Belt Road, right in the middle of New Plymouth, and each time another wave

broke it pounded the mine on the rocks. The men of 2/C Company were called to the scene and it was quickly obvious they needed to move fast to secure the potentially explosive situation. The heavy seas made it too risky to attempt sarm the mine on the spot, so it was decided they had to tow it of the rocks and away from the heavily built-up

Meanwhile, in Wellington, the commander of the Army Engineers, a Major Hornibrook, was an extremely nervous man. He knew that under the Geneva Convention, a mine was meant to be designed so that if it parted from the anchor cable, the loss of tension on the mooring spindle was supposed to allow the arming device to slide back in, disarming the mine. However, this often failed to happen due to marine growth or rust forming on the exposed parts of the spindle.

Was the mine bouncing on the rocks in New Plymouth armed or disarmed? And if it was disarmed, did the men of 2/C Company know that under no circumstances were they to attach a rope to or even touch that spindle for fear that

the mine might re-arm itself?

Major Hornibrook tried to contact the Company's commander, New Plymouth refrigeration engineer Dick Naylor, at his home. His wife, May, busy caring for their baby, advised that he had already left for the Belt Rd site.

The major asked if Mrs Naylor would get an urgent message to her husband. Tell him that whatever he does, for Christ's sake don't touch or attach anything to the mooring spindle. It can be lethal. Get that message to him quick-

," he said, and hung up.

Mrs Naylor lived on Barrett St, Westown. In a panic, she strapped her baby — now well-known Taranaki photographer Fay Looney — into a pram and took off at full speed for Belt Rd two kilometres away. When she breathlessly reached a police road block she passed the message on to the authorities, who very quickly contacted O/C Naylor.

But the bomb disposal men knew But the bomb disposal men knew what they were doing. They had kept well clear of the spindle, attaching the rope to a lug on the mine's casing. Por Taranaki's pilot launch was called to the scene and it positioned itself just off the breaker line, and attempts then began to get the rope out to it.

A dinghy put off from the vessel, but it was unable to negotiate the surf. Then young George Wood had an idea. A strong swimmer, he volunteered to take the rope out to the waiting dinghy.

A large bowline loop was tied in the end of the rope so he could free himself should it become entangled, and Wood entered the water. Rope in hand, he battled through the breakers to reach the waiting dinghy, which was being rowed by Harbour Master Captain Mc-Intyre and, together, they headed out to the pilot launch, secured the rope, and took up the tow.

NCE the German mine had been moved clear of the rocks, thanks moved ciear of the rocks, tanks to the combined lifting efforts of other members of the group and the pulling owner of the launch, George Wood had a second idea; he would swim back to shore sain. Despite the serious niegrings of those about the launch, he dived into the sea and headed for the

It was a silly and almost tragic thing to do. First, Wood came very close to being run over by the mine itself as it bobbed past on its journey out to sea, and then he began to tire in the worsening surf and soon was being dashed on

to the rocks by each wave.
But help suddenly materialised in the form of his sergeant, New Plymouth accountant Frank Morine, who waded into the surf and held the almostdrowned youngster's head above the water as he dragged him ashore. Both men were badly knocked about and had to be taken to hospital to have abrasions essed and to get tetanus injections.

Meanwhile, the pilot launch towed the mine to the eastern side of the Waiwakaiho River and allowed it to

drift ashore on to an empty beach. There, the men of 2/C Company dragged it clear of the water and began the task of disposing of it.

This proved to be a very nervous operation. The mooring spindle was bent and it could not be determined whether the mine was armed or not. An inspection plate on the casing was gingerly re-moved, the internals were checked for booby traps, wires from the mine's horns were cut by men who took extra care not to earth anything, and the primer charge and detonator were removed.

And so ended the only time 2/C Company Bomb Disposal Group got itself fully involved in World War II. For the next few months, the organisation busied itself with constant training, but by the end of 1943 the war in the Pacific had turned in favour of the allied forces and the threat of invasion of New Zea-

As a consequence, the decision was taken to disband all bomb disposal units. New Plymouth's 2/C Company held its final active parade in December 1943, then had a field day at its Bell Block training ground where it blew up every type of explosive it had left.

It was a memorable day of big bangs. Large 250lb bombs, anti-personnel bombs, mortar shells, hand grenades, demolition dynamite and gelignite was all exploded. Some of the gelignite had started to sweat and was considered unstable, so it was detonated by the

The explosions lasted the entire day and at the end of it all, after a year and a half of action, heroism and hair-raising antics, 2/C Company Bomb Disposal Group disappeared as quickly as it

☐ This weekend the remaining members of the original 38-man group gather in New Plymout to celebrate the 55th anniversary of the Belt Road incident. The men — Ben Dixon, Noison, Frith, Eric Greedy, Sid Holtz, Alan Joinston, Pat Riorden, George Wood and Frank Morine will attend a special dimere in the city.
